

Project Logbook

Project Title: *SIH-1710: Enhancing Navigation for Railway Station Facilities and Locations*

Week 1: Project Planning and Requirement Analysis

Overview:

In the initial week, the team focused on comprehending the Smart India Hackathon 2023 problem statement (SIH-1710), which aims to simplify indoor navigation in large and often confusing railway stations using modern technologies like Augmented Reality. The purpose was to analyze the user's needs, recognize pain points in existing systems, and plan a direction that balances innovation with practicality.

Progress:

- Conducted a detailed reading and breakdown of the SIH-1710 problem statement.
- Organized team meetings to ideate and brainstorm feasible solutions and user-focused features.
- Identified key modules: AR navigation, station mapping, cloud database integration, and mobile-friendly UI/UX.
- Assigned specific roles to each team member based on individual expertise (UI design, backend, AR integration, etc.).
- Chose development tools including Android Studio (Java), Firebase, ARCore, and Figma.
- Created the initial flowchart and architecture diagram for the system.
- Set up team task boards on Trello and communication channels for smooth collaboration.

Summary:

Week 1 laid a strong foundation by establishing clear objectives, dividing tasks efficiently, and finalizing initial tools and technologies. We now have a vision and a well-defined roadmap for the next development stages.

Next Week and Beyond:

The next steps include finalizing the tech stack and gaining practical experience with Firebase and ARCore. We will begin prototyping key design ideas using Figma to bring the concept into visual structure.
