

Week 3: UI/UX Design and Interactive Prototyping

Overview:

The third week focused on designing user-friendly and visually cohesive interfaces. A well-thought-out UI/UX is critical for our target audience, which includes elderly users, tourists, and differently-abled individuals navigating crowded stations.

Progress:

- Created multiple wireframe screens using Figma for home page, login, map view, and AR launch.
- Designed navigation flow between app modules based on ease-of-use testing scenarios.
- Applied standard design principles like color contrast, icon clarity, and font readability.
- Conducted peer reviews to gather UI feedback and suggestions.
- Iterated on design elements such as button sizing, placement of map markers, and transitions.
- Developed a clickable prototype to simulate basic interactions.
- Ensured that the design complies with Android accessibility and UI guidelines.
- Reviewed ARCore layout constraints to accommodate AR triggers and anchors in the UI.

Summary:

The interface prototypes are functional and user-friendly. These designs will act as blueprints for the actual app. Users responded positively during testing and feedback was incorporated efficiently.

Next Week and Beyond:

In Week 4, we will set up the Android Studio project and begin connecting it with Firebase for authentication and location storage features.
